

Answer Key - Missing Data Tutorial

After viewing Missing Data Tutorial, use the steps outlined to check the 'messy' dataset and resolve any missing data. 'Answers' can be found below.

For recent_idu variable (Column J):

- There are four blank values, indicating that either the interviewer did not ask the question, or the respondent chose not to answer. If the survey was completed on paper, make sure to cross reference first and make sure that there is truly no answer on the paper in order to confirm that it was not a data entry error. Once you have established that it was not a data entry error, blank values should be changed to **NA** to indicate missing and facilitate analysis.
 - This is for UID 61, 73, 53, and 68.
